Arkansas River Basin Forecast Points (Colorado)

Forecast Point	Drainage Area	Forecast Type
ARGC2	427	Native Flow
PTRC2	795	Native Flow
SALC2	1,218	Native Flow
CNCC2	3,060	Native Flow
PDAC2	4,670	Native Flow
CLVC2	56	Native Flow*
HMZC2	73	Native Flow*
CHKC2	88.7	Native Flow*
GCWC2	320	Native Flow*
	New Points	
LARC2	14,245	Observed Flow
LAPC2	3,441	Observed Flow

Canadian River Basin Forecast Points (New Mexico)

Forecast Point	Drainage Area	Forecast Type
EGLN5	167	Native Flow
CMMN5	294	Native Flow
CNCN5	7,409	Native Flow*
CRCN5	65	Native Flow*
CMRN5	294	Native Flow*
DAWN5	301	Native Flow*

* Indicates no adjustments are made to the data to account for upstream reservoirs or diversions.

RED Indicates unique verification conditions

Water Supply and Data Assimilation at the ABRFC

Summary Data

Group	Number	Drainage Area Average and Range
Colorado Points Native Flow	9	1,190 mi ² (56 – 4,670)
Colorado Points Observed Flow	2	8,843 mi ² (3,441 – 14,245)
New Mexico Points	6	1,422 mi ² (65 – 7,409)

Water Supply and Data Assimilation at the ABRFC

Current Methods

- Statistical Water Supply
 - Multivariate Regression Based Forecast methods
 - Static. Suited to once monthly deterministic forecasts
 - Can be and is used to generate probable maximum and minimums
- Ensemble Streamflow Prediction
 - Runs a hydrologic model with historical weather data
 - Creates an ensemble of “potential” hydrologic outcomes
 - 1 hydrologic outcome for each year of historical data
 - 50th percentile of the ensemble is used as a deterministic forecast
- Coordination with experts at the NRCS
 - NRCS forecasters produce similar forecasts
 - Historically a single value was coordinated between agencies
 - Now forecasts are collaborative but may differ

Water Supply and Data Assimilation at the ABRFC

Current Methods

- SWS and ESP forecasts were combined (usually but not always averaged)
- NWS average was relayed to NRCS and compared to their forecast.
- ABRFC and NRCS would come to agreement on a final deterministic forecast.
- The SWS software would be used to calculate a new probable max/min values based on distributions associated with the primary forecast equation.

Chances of Exceeding Native Volumes at SALC2 - ARKANSAS RIVER AT SALIDA
 Latitude: 38.545834 Longitude: -106.01
 Forecast for the period 04/01/2014 - 09/30/2014
 This is a conditional simulation based on the current conditions as of 04/02/2014

Probabilistic ESP product with HEFS addition.

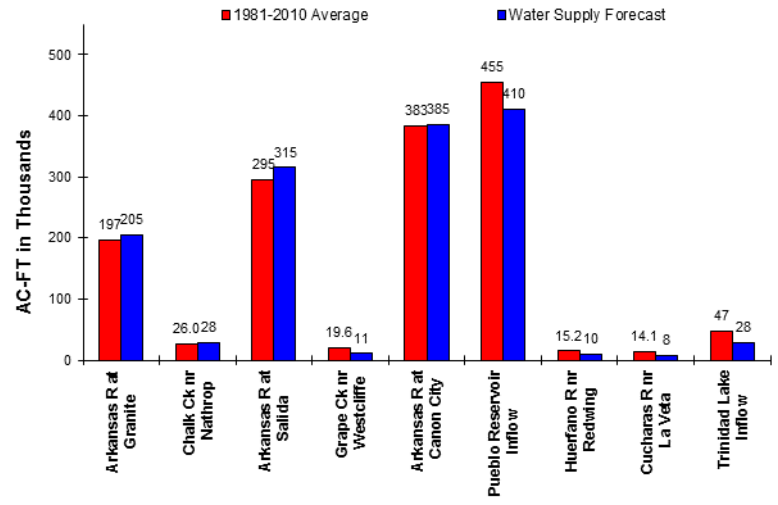

Water Supply and Data Assimilation at the ABRFC

WATER SUPPLY FORECASTS - UPPER ARKANSAS BASIN IN COLORADO
 Water Supply - April thru September, 2014
 Forecasts made on May 7, 2014, based on 0.50 Exceedance Probability

Water Supply Forecast Points

WATER SUPPLY FORECASTS - LOWER ARKANSAS BASIN IN COLORADO
 Water Supply - April thru September, 2014
 Forecasts made on May 7, 2014, based on 0.50 Exceedance Probability

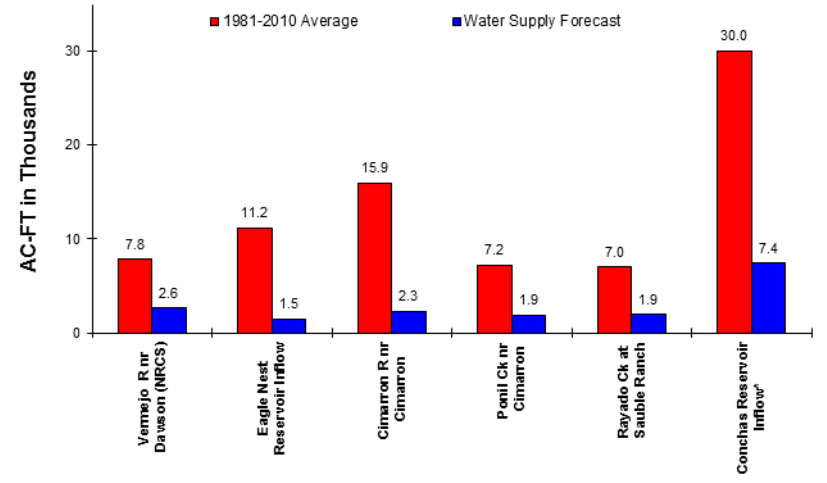

* Values represent historical or forecast OBSERVED values, not unregulated or "native" flow values.

Water Supply and Data Assimilation at the ABRFC

Arkansas River at Salida 2014 Forecasts and Native Flow

Water Supply and Data Assimilation at the ABRFC

Problems in Methodology

- Relationship between deterministic forecasts and the probable max/min are suspect
- Western customers are requesting more frequent forecasts with more uncertainty information
- SWS software is ancient and is losing support
- Increased Emphasis on ESP and HEFS as our primary forecasting tools
- Current method does not allow for increased forecast frequency

Water Supply and Data Assimilation at the ABRFC

Solutions (and new problems)

Solutions

- HEFS and ESP
 - Provide consistent probabilistic forecasts
 - Can provide an array of forecast graphics and products
 - Allow for increased forecast frequency
 - Better able to identify trends through forecast season

New Problems

- No requests by customers for probabilistic forecasts
- No requests by customers for increased forecast frequency
- SWS may be our best forecasting tool for deterministic forecasts
- NRCS definitely adds value to our deterministic forecasts
- HEFS is currently under development and testing.

Water Supply and Data Assimilation at the ABRFC

SALC2 ESP-HEFS-FORECAST FOR 2014

Water Supply and Data Assimilation at the ABRFC

Questions moving forward

- Can we continue to provide the same deterministic forecasts and the same skill, in the new probabilistic paradigm?
- How can we assimilate the skill of the NRCS into our forecasts?
- How can we assimilate the deterministic predictive skill of station data (SWS)?
 - NRCS SNOTEL and Snow course Data
 - NOHRSC Snow Water Equivalent estimates
 - Precipitation data

Water Supply and Data Assimilation at the ABRFC

Solutions

- Benefit from the experience of others.
 - Learn from those who went before us
 - (and steal their ideas)
 - Improve our model
 - Improve our precipitation estimation
- Education
 - Outreach
 - Training
- Innovation
 - Force the system to provide what our customers want

Water Supply and Data Assimilation at the ABRFC

Solutions

- More Intense Model Balancing
 - Increased Frequency
 - Increased Intensity
 - Improve data ingest of location and time specific sources
- Model Calibration
 - Greater emphasis on SNOW-17 calibration
- Innovation
 - Force the system to provide what our customers want

Water Supply and Data Assimilation at the ABRFC
