Remote Access to Linux machines

All JSG people have access to 21 different Linux machines where we can run various scripts remotely. He did not recommend using any of the machines you have on the 6th floor. It seems these other machines are always available and fast. If anyone else in the group is interested in using them, here is the information:

Machines:

seismic1.geo.utexas

seismic2.geo.utexas

...

...

...

seismic20.geo.utexas

(where there are '20' different machines named similarly but with a different integer value)

thunderhead-2.geo.utexas.edu
